

Graphyti Progress Report – May 2026

Product Development

Urban Scene Expansion

- Replaced the previous single rectangular city tile with a new multi-plot city generation system
- Added automatic road connectivity between neighboring plots to improve navigability
- Introduced a zoning system where each district uses different generation logic
- Created more visually distinct and realistic urban environments with greater variation

Forest Scene Generation

- Developed procedural forest environments using uneven terrain and rolling hills
- Added naturally flowing rivers integrated directly into the terrain
- Generated interconnected trails and pathways to improve exploration and realism
- Enabled more varied and believable outdoor environments with each generation

Dynamic Lighting System

- Implemented a full automated 24-hour day-night cycle
- Supports both continuous live simulation and manual time control
- Designed for future integration with AI assistant controls and dynamic simulations

Atmospheric Effects

- Added a dynamic fog system to improve scene atmosphere and environmental depth
- Established the foundation for a larger weather framework
- Future planned features include:
 - Rain
 - Snow
 - Seasonal variation
 - Additional environmental effects

Visual Style Exploration

- Added support for toon-shaded rendering styles
- Enables environments to shift into cartoon or anime-inspired aesthetics without rebuilding scenes
- Began experimenting with painterly rendering styles
- Expands flexibility for synthetic dataset generation across multiple artistic domains

Marketing

Narrative-Driven Brand Strategy

- Began developing Graphyti as a fictional narrative universe rather than a traditional company brand account
- Launched experimental storytelling strategy across:
 - TikTok
 - X
 - Xiaohongshu

Archive / Recovered Footage Concept

- Present Graphyti-generated environments as “recovered footage” from alternate timelines and unknown worlds
- Feature environments such as:
 - Post-apocalyptic cities
 - Dreamcore spaces
 - Fantasy worlds
 - Uncanny landscapes
 - Futuristic environments

Mystery & Audience Engagement

- Use minimal in-universe captions such as:
 - Dates
 - Coordinates
 - Incident logs
- Encourage audience speculation and collaborative storytelling rather than direct explanation
- Gradually introduce glitches, wireframes, and simulation artifacts to hint at the technology behind the footage

Long-Term Goal

- Build audience engagement through curiosity and worldbuilding
- Organically showcase Graphyti’s scene generation capabilities and visual identity

Achievements

- Selected as a **Top 10 Finalist** for the **CTP Pinnacle Prize Competition**
- Continued expansion of Graphyti's procedural environment systems
- Established the foundation for Graphyti's long-term visual and narrative identity

Next Steps

Environment Systems

- Expand weather and atmospheric simulation systems
- Continue improving environmental diversity and realism
- Develop additional biome and world-generation systems

Visual Rendering

- Further explore stylized rendering pipelines
- Continue experimentation with painterly and non-photorealistic visual styles

AI & Simulation Integration

- Integrate environment controls with future AI assistant systems
- Improve support for synthetic data generation workflows

Marketing & Storytelling

- Continue developing the archive-based narrative universe
- Introduce deeper lore and recurring anomalies gradually over time
- Expand short-form content production across social platforms
